The present application relates to a method for the catalytic hydrogenation of methylol alkanals of the general formula (cf. claim 1) in liquid phase on a hydrogenation catalyst, characterised in that, by adding at least one tertiary amine, a pH value of 6.3 to 6.8 can be set in the hydrogenation feed.

D1 is considered the closest prior art and differs from the subject matter of claim 1 in that the pH value of the hydrogenation feed is not disclosed.

The problem addressed by the present invention can therefore be considered the provision of an improved method for the catalytic hydrogenation of methylol alkanals. Although in D1 (cf. the passages cited in the search report) a tertiary amine is added to the hydrogenation feed, it is not obvious to a person skilled in the art to set the pH value of the hydrogenation feed

at 6.3 to 7.8 by adding a tertiary amine. As is apparent from table 1 of the present application, the yield of neopentyl glycol produced by hydrogenation at a pH of 7.4 is 93.04%, but with pH values of 5.3 and 8.3, it is less than 92%.

The subject matter of claims 1-9 therefore meets the criteria of PCT Article 33(2) and (3).
